MINT PRINTWORKS · TEAM REVIEW EDITION · SEPTEMBER 8, 2026

Printavo Hub — Complete Synopsis

A plain-language guide to what the Hub is, how its sections fit together, what each page is intended to accomplish, and where team feedback can have the greatest impact.

> **In one sentence:** The Printavo Hub is Mint Printworks' internal operating layer around Printavo—bringing information and workflows that were spread across separate apps into one staff-controlled place while leaving Printavo as the primary production system of record.

How the Hub is organized

The left navigation groups work by business purpose. Staff see only modules that are enabled for them; administrators can manage access. Some pages are detail screens reached from a list rather than separate navigation links. The **global sync bar** communicates how fresh the local Printavo data is and allows a manual refresh.

1. Dashboard
2. Analyze
3. Sales
4. Clients
5. Purchasing
6. Production
7. Quoting
8. Team
9. Shipping
10. Mint Bucks
11. Data
12. Settings & access
13. Customer Reorder Portal

Dashboard

Dashboard

BUILT

Starting point for operational awareness.

The Dashboard summarizes the Hub and its current data state, surfaces useful counts and activity, and provides shortcuts into major workflows. Its intended role is to answer "what needs attention?" without requiring staff to visit every module.

Page	Ability and intended function
Dashboard	High-level business and sync overview; launch point into the tools each user has permission to access.

Analyze

Reporting, intelligence, knowledge & communication

EVOLVING

Turns operational data and conversations into answers and context.

Page	Ability and intended function
Reports	Browse and filter order/revenue data from the local Printavo mirror. Intended for reliable operational and historical analysis without slowing or repeatedly querying Printavo.
Payments	Review payment history and cash-basis information across the available historical range.
Ask AI	Ask plain-English questions over approved Hub data. The system creates a guarded, read-only query and displays the answer with its supporting table/query. Saved presets make useful questions repeatable.
Knowledge Base	Store and curate internal FAQs, SOPs, and reference knowledge for both staff and AI tools. Intended to make approved company knowledge consistent and reusable; learning remains human-approved.
AI Connections	Administrator control center for AI consumers, access, audit, rate limits, and kill switches. Intended to keep AI integrations governed rather than scattered across apps.
Voice Profiles	Capture writing traits and examples so AI-assisted drafts sound appropriate for Mint and individual teammates without storing a dossier of private content.
Email Activity	Analyze authorized mailbox activity and customer/deal correspondence patterns. Supporting settings and deal-report pages are reached from this area.
Email Access	Admin-only controls for which staff, groups, owners, or explicit grants can see mailbox and thread data.
Correspondence	Customer-centered view of authorized email threads. Intended to help staff understand the history and current state of a relationship without searching multiple inboxes.

Feedback focus: Which questions, reports, and correspondence views recur often enough to become presets or primary dashboard actions?

Sales

Product selection, pipeline, stores & reorders

EVOLVING

Supports the work between an opportunity and a confirmed production order.

Page	Ability and intended function
Product Finder	Search SanMar and S&S product catalogs, compare styles, colors, sizes, images, costs, and live inventory. Intended to shorten sourcing and improve product recommendations.
Garment Pantones	Look up garment/color references and Pantone-related information for closer color communication and production decisions.
Collections	Create curated groups of products and open collection detail views. Intended for internal product recommendations and, later, reusable customer curation/sell sheets.
Pipeline	Filter and review active sales/order opportunities, with customer links and relevant status. Intended as the daily “what is moving, stuck, or next?” sales view.
Status Activity	See recent order status movement. Intended to highlight throughput, handoffs, and exceptions rather than only a static pipeline snapshot.
Chipply Stores	Import and manage Chipply web-store events, review store detail, and link them live to related $0 Printavo production shells. Chipply revenue remains separate from Printavo revenue.
Reorder Requests	Staff inbox for customer submissions from the Reorder Portal. Requests can be reviewed, expanded, and moved through New, In Progress, and Done.

Feedback focus: What should a salesperson see first each morning, and what single next action should each sales page make obvious?

Clients

Client 360

BUILT

A consolidated, practical customer memory.

Page	Ability and intended function
Directory	Search and browse customers, generally emphasizing valuable relationships. Intended to replace fragmented customer lookups and provide a path to each client profile.
Customer Profile	Review spend, order frequency, average pieces, top styles, decoration mix, orders, contacts, niches, Chipply context, authorized correspondence, and artwork/brand information where available.
Brand Sheet	Customer-specific summary of reusable brand information. Intended to make future quoting, art, and production choices more consistent.
Niche Report	Assign and analyze customer niches/categories, including bulk matching by order nickname. Intended for segment-level selling and business analysis.

Feedback focus: What customer facts are repeatedly re-discovered, and which belong at the top of every profile?

Purchasing

Vendor ordering and fulfillment visibility

BUILT

Moves approved garment needs into safe, trackable vendor orders.

Page	Ability and intended function
Reorder Scan	PLACEHOLDER Reserved for a dedicated needs-ordering scan experience; no active page yet.
Vendor Orders	Find items needing purchase, obtain live SanMar/S&S pricing and inventory, build carts, choose warehouses, create POs, push approved information to Printavo, and electronically submit guarded vendor orders.
PO Log	Track created purchase orders, locks, submission state, exceptions, and related order context. Intended as the audit trail and recovery point for purchasing.
Order Tracking	See shipment/tracking information returned by vendors and connect delivery progress to the related work.
Status Rules	Configure suggested Printavo status changes tied to purchasing milestones. Staff retain confirmation; automation is guarded.

Feedback focus: Which exception cases still force staff back into vendor sites or spreadsheets?

Production

Print queues and controlled automation

VALIDATE

Organizes workorders and production-stage actions.

Page	Ability and intended function
Print Queue	Filter workorders by status, select/exclude orders, generate combined print views, include attachments, and perform guarded bulk status changes.
Queue Rules	Define how qualifying work enters or moves through queues, using off/ask/auto behavior and safety controls.
Auto-Print	Schedule and monitor automatic workorder printing to PrintNode, with duplicate protection and optional status movement. Intended to reduce repetitive production preparation while preserving a safe dry-run state.
Packing slips & box labels	Render Mint-controlled paperwork from local data, including QR/shop/customer sections and item matrices.
Color Library	PLACEHOLDER Reserved for a shared production color database; no active page yet.

Feedback focus: Validate physical output, printer ownership, queue definitions, and failure recovery before enabling more automation.

Quoting

Pricing and reviewable draft creation

EVOLVING

Speeds quote preparation while keeping pricing decisions visible.

Page	Ability and intended function
AI Quote Drafts	List, filter, open, edit, and review AI-assisted quote drafts. Detail pages include customer/order context, pricing, notes, and matrices. Intended to prepare—not autonomously send or finalize—repeatable quote work.
Price Calculator	Apply decoration matrices and vendor garment costs using the established Breezy Quote math, inspect a detailed cost breakdown, import matrices, and export quote visuals.

Feedback focus: Which draft patterns are genuinely useful? Complete the 50-draft keep/drop review before expanding automation.

Team

Tasks (moMINTum)

BUILT

Shared work management connected to Printavo tasks.

The Tasks link opens the moMINTum artifact, which shares its live task database with the existing standalone app. It supports team lists, assignments, completion, and guarded two-way Printavo task synchronization. It remains a separate app surface linked from the Hub rather than a Hub route.

Feedback focus: Are tasks created in the right place, routed to the right person/list, and visible at the right moment in customer/order workflows?

Shipping

Rates and document organization

BUILT

Reduces manual shipping comparisons and sorting.

Page	Ability and intended function
Rate Estimator	Compare USPS/UPS rates from connected services, calculate weights, use preset boxes, and parse pasted addresses.
Label Sorter	Upload packing slips and labels, sort by configurable style/color/size/order rules, pair USPS labels one-to-one, and produce a match report.

Feedback focus: Test against the real package types, carriers, exports, and sorting sequences staff use.

Mint Bucks

Customer store-credit program

CONTROLLED

Full loyalty and credit administration in the Hub.

Page	Ability and intended function
MB Dashboard	Program summary and quick operational view.
Customers	Browse balances and open customer credit histories.
Credits	Issue and inspect credits, certificates, expiration, notes, and associated rewards.
Redemptions	Review how credits were used and maintain the redemption record.
Rewards	Configure reward rules, branded email images, and test communications.
Reports	Analyze issued, available, redeemed, and certificate activity.
Check Credit	Look up a certificate/code and verify available value.
MB Settings	Control allowed program behavior and polling interval while protected credential fields remain read-only.

Important: Hub and standalone Mint Bucks share live data. Only one poller should own reward/order automation, and test-mode actions can consume one-time ledgers.

Data

Backups

STRENGTHEN

Business continuity and portable copies.

The Backups page monitors and triggers the Hub’s full Printavo archive/export process, including historical business records and mirrored files where accessible. It provides a portable recovery asset, but it is not a one-click restore into Printavo. Independent offsite copies, retention, integrity checks, and a restore drill are the highest-priority resilience improvements.

Settings & access

Administration

BUILT

Controls who can enter and which tools they can use.

Settings manages the staff allowlist, roles, module availability, administrative PIN, and operational defaults such as purchasing ship-to information. Admins can bypass module readiness gating; staff/managers see only enabled tools. Module visibility supports staged rollout, while sensitive data permissions—especially email—are enforced separately.

Customer-facing Reorder Portal

Reorder Portal + Hub inbox

NEW

A separate public experience connected to the internal Hub.

Customers can search eligible prior orders by email or company name, review order details, select products/quantities, and submit a reorder request. Search results can be shared through a URL that preserves the search. Staff receive and manage submissions in the Hub’s Reorder Requests page.

Current privacy model: a shared URL is a saved public search, not a private authenticated link. Private company links, visitor check-in, and direct invoice creation are intentionally deferred until the current experience is reviewed.

What is intentionally not “finished”

- **Reorder Scan and Color Library:** visible placeholders without active pages.
- **Automation ownership:** some pollers, emails, PrintNode actions, status rules, and external writes remain guarded by test modes, dry runs, confirmations, or one-environment ownership.
- **AI:** designed for reviewable answers, drafts, and suggestions—not broad unsupervised action.
- **Communication integrations:** email/correspondence capabilities are evolving; Fireflies and other sources require access/visibility validation first.
- **Backup recovery:** exports exist; independent offsite redundancy and practiced restoration need strengthening.

Team feedback worksheet

For each workflow the teammate reviews, capture the answers below. Focus feedback on outcomes rather than feature lists.

1. Job to be done

2. Current workaround

What were you trying to accomplish?

How do you do this today, and how long does it take?

3. Friction

Where did you hesitate, backtrack, or leave the Hub?

4. Missing context

What information did you need but could not see?

5. Next action

Was the correct next step obvious?

6. Frequency

Daily, weekly, monthly, or rare?

7. Impact

Does improvement save labor, reduce errors, protect revenue, or improve service?

8. Confidence

Would you trust the data/action enough to use it in real work?

Suggested ranking method

Score each requested improvement from 1–5 on **frequency**, **time saved**, **risk reduced**, **revenue/customer impact**, and **confidence it can be adopted**. Subtract 1–5 for implementation complexity. The highest totals should become the next focused refinements; low-frequency “nice to have” ideas stay in the backlog.

Prepared as a companion to the canonical “Printavo Hub — Plan, Status & Roadmap.” This synopsis describes intended product behavior in plain language; guarded live-write and access rules remain controlling.
