PRODUCT CONCEPT • HANDOFF DOCUMENT

Printavo Bulk Operations

Prepared October 4, 2026 • Standalone app concept • Scope and recommendations, not an approved implementation plan

Purpose

A standalone, Printavo-centric application for reviewing and applying bulk changes across orders, line items, and tasks. It would reuse relevant integration and safety logic from the existing Printavo Hub without bringing along the rest of the Hub.

The user specifically identified **category changes, line-item product/goods statuses, order-status changes, and task completion**. The additional operations below are candidates for the same product.

> **Capability labels:** “Existing foundation” means related Printavo integration code exists in the current project—not that a finished standalone bulk tool exists. “Verify” means API support or behavior still needs confirmation. No new live API verification was performed for this document.

1. Line-item operations

Operation	Example use	Starting point
Change categories	Assign Screen Printing, Embroidery, Transfers, or another category across selected lines or orders.	Existing foundation
Change product/goods status	Mark garment lines as needing ordering, ordered, arrived, partially received, or received.	Existing foundation
Change product/style numbers	Replace an obsolete style number across selected open orders.	Existing foundation
Change garment colors	Correct inconsistent names or apply an explicitly approved substitution.	Existing foundation
Change size quantities	Apply reviewed spreadsheet corrections, with different quantities for each line.	Existing foundation; higher risk
Find/replace descriptions	Standardize decoration instructions or correct repeated wording.	Verify API support
Change pricing or costs	Apply percentage adjustments, fixed amounts, or spreadsheet-supplied values.	Verify API support; higher risk
Reorder line items	Apply a consistent display order to products and decoration groups.	Investigate behavior and API constraints

Goods-status boundary: Target individual line items. Do not assume that an order-level goods summary is independently editable.

2. Order and quote operations

Operation	Example use	Starting point
Change order status	Move selected orders between workflow statuses.	Existing foundation
Append production notes	Add a shared instruction while preserving existing notes.	Existing foundation
Find/replace note text	Correct outdated production instructions with a before-and-after preview.	Existing foundation
Attach production files	Add a common instruction sheet or production reference to selected orders.	Existing foundation
Change production due dates	Shift jobs two business days or assign individual dates from a CSV.	Verify API support
Change customer due dates	Reschedule orders affected by a delay.	Verify API support
Change order nicknames	Add event numbers, standardize names, or correct matching prefixes.	Verify API support
Reassign order ownership	Move work to another salesperson or production owner.	Verify available fields/API support
Correct customer/contact links	Fix orders associated with the wrong customer or contact.	Verify API support; higher risk

Customer-visible consequences: Order-status changes can trigger customer emails or other Printavo automations. Warn explicitly before committing; do not represent status changes as internal-only edits. Confirm quote-versus-invoice support separately for each operation.

3. Task operations

Operation	Example use	Starting point
Complete tasks	Complete matching “Order garments” tasks across selected orders.	Existing foundation
Reopen tasks	Mark work incomplete when it needs to be repeated.	Existing foundation
Create tasks in bulk	Add “Confirm delivery address” to selected orders.	Existing foundation
Apply task checklists	Add standard tasks to orders missing that checklist.	Build on task creation
Reassign tasks	Transfer work between staff members.	Verify supported task fields
Reschedule task due dates	Shift related tasks when production dates change.	Verify supported task fields
Rename/standardize tasks	Replace inconsistent names with standard wording.	Build on task updates
Remove duplicate/obsolete tasks	Preview and remove repeated checklist entries.	Existing deletion foundation; higher risk

Task-selection boundary: Support task name plus order filters. Completing selected tasks must not silently complete every task on each order.

4. Bulk production actions

These are useful additions even when they do not change Printavo records. Their standalone packaging and any additional API requirements still need scoping.

- **Print workorders** for selected orders.
- **Download order PDFs** as a batch.
- **Export selected orders and line items** to CSV.
- **Generate purchasing lists** grouped by vendor, style, color, and size.
- **Identify missing categories, goods statuses, or tasks** and open the relevant bulk-fix screen.
- **Compare a spreadsheet against Printavo** and propose only the differences.
- **Run combined actions:** for example, mark selected garments ordered, complete their purchasing tasks, and optionally change order status.

> **Combined actions are not an atomic transaction.** Each step must report its own result. Do not imply that Printavo can automatically roll the entire sequence back if a later step fails.

5. Features shared by every operation

Selection and review

- **Flexible selection:** paste order numbers, upload a CSV, or filter by status, customer, dates, category, product, and task.
- **Bulk selection:** select all matching records or only individually selected rows.
- **Before-and-after preview:** show every proposed change before applying it.
- **Explicit write mode:** distinguish “fill blanks only” from replacing populated values.
- **Exclusions:** skip completed orders or other excluded records.
- **Reusable workflows:** saved filters and operation presets.

Execution and recovery

- **Recheck current values before writing:** an outdated preview must not overwrite another person’s intervening changes.
- **Batch progress and per-record results:** clearly identify successes, skips, failures, and partial completion.
- **Change history:** record who changed what, when, and the previous value.
- **Safe retries:** avoid duplicate tasks, appended notes, and attachments. An uncertain write result needs verification rather than a blind repeat.
- **Controlled reversal where possible:** provide operation-specific recovery, not a blanket promise of “undo.”

RECOMMENDED STARTING SCOPE

6. Recommended first version

This is a recommendation for prioritization, not an approved build commitment.

Priority	Initial capability	Why include it
1	Bulk category changes	Core user request with an existing foundation.
2	Bulk product/goods-status changes	Core purchasing and receiving workflow.
3	Bulk order-status changes	High-value workflow action, with explicit automation warnings.
4	Bulk task completion and reopening	Core user request with task integration already present.
5	Bulk production-note appending	Useful shared instructions without replacing existing notes.
6	CSV-driven corrections with preview	Reusable input and review workflow for supported fields—not permission to edit every Printavo field.

Defer initially: pricing/cost edits, customer reassignment, and deletion tools. Mistakes in these areas have greater financial or operational consequences.

7. Suggested common workflow

> **Select records → Choose operation → Configure changes → Review differences and warnings → Confirm → Track results → Inspect failures or recover.**

Each operation should use this same interaction pattern. The exact write rules, warnings, and recovery options must remain specific to the operation.

8. Engineering handoff notes

- **Reuse selectively:** the existing project contains foundations for line-item updates, categories, statuses, task changes, production notes, production-file attachment, and related production workflows. Extract the relevant pieces rather than copying the whole Hub.
- **Verify before promising support:** confirm each proposed field and operation against Printavo's API, including behavior differences between quotes and invoices.
- **Preserve safety:** retain explicit approvals, fresh-value checks, per-record outcomes, and duplicate-write protections when moving logic into the standalone product.
- **Scope the standalone connection model:** authentication, Printavo account connection, permissions, and single-account versus multi-account use remain design questions. They were not decided in this discussion.
- **Start with one reusable batch engine:** the recommended selection, preview, execution, and audit controls should support the initial operations and later additions.

Decision status

The user is considering a standalone app and requested an operation inventory and handoff document. This document records that concept and the recommendations made so far. It does not authorize implementation, live Printavo writes, a deployment, or every item in the candidate inventory.
